Triggers: The Global Quantities contain triggers that allow one to change coupling settings, Salicylic acid (SA) treatment and *npr1* mutants.

LHY_on: true->NPR1 couples to LHY

PRR7_on: true->NPR1 couples to PRR7

WT: true->WT plants, false->*npr1* mutant plants

SA: true->SA treated plants, false->no treatment

This model has $L=1$, i.e. operates only under constant light conditions and is not aiming to make predictions under diurnal conditions. Due to period overshoot only time points after 28h are relevant.

This model is described in the article: [Redox rhythm reinforces the circadian clock to gate immune response](#). Zhou M, Wang W, Karapetyan S, Mwimba M, Marquis J, Buchler NE, Dong X. Nature 2015 Jun;

Abstract:

Recent studies have shown that in addition to the transcriptional circadian clock, many organisms, including *Arabidopsis*, have a circadian redox rhythm driven by the organism's metabolic activities. It has been hypothesized that the redox rhythm is linked to the circadian clock, but the mechanism and the biological significance of this link have only begun to be investigated. Here we report that the master immune regulator NPR1 (non-expressor of pathogenesis-related gene 1) of *Arabidopsis* is a sensor of the plant's redox state and regulates transcription of core circadian clock genes even in the absence of pathogen challenge. Surprisingly, acute perturbation in the redox status triggered by the immune signal salicylic acid does not compromise the circadian clock but rather leads to its reinforcement. Mathematical modelling and subsequent experiments show that NPR1 reinforces the circadian clock without changing the period by regulating both the morning and the evening clock genes. This balanced network architecture helps plants gate their immune responses towards the morning and minimize costs on growth at night. Our study demonstrates how a sensitive redox rhythm interacts with a robust circadian clock to ensure proper responsiveness to environmental stimuli without compromising fitness of the organism.

9 Derived Rate Equations

When interpreted as an ordinary differential equation framework, this model implies the following set of equations for the rates of change of each species.

Identifiers for kinetic laws highlighted in gray cannot be verified to evaluate to units of SBML substance per time. As a result, some SBML interpreters may not be able to verify the consistency of the units on quantities in the model. Please check if

- parameters without an unit definition are involved or
- volume correction is necessary because the `hasOnlySubstanceUnits` flag may be set to `false` and `spacialDimensions` > 0 for certain species.
