1 General Overview

This is a document in SBML Level 2 Version 4 format. This model was created by Enuo He¹ at October 19th 2006 at 10:21 a. m. and last time modified at February 25th 2015 at 1:04 p. m. Table 1 provides an overview of the quantities of all components of this model.

Model Notes

This model is according to the paper *Toward a detailed computational model for the mammalian circadian clock*

In this model interlocked negative and positive regulation of Per,Cry,Bmal,REV-ERBalpha genes are all involved. The model is actually robust so the initial conditions are unimportant. We gave every entity zero as initial value, and start the graph at time=132h.

¹University of Oxford, enuo.he@wolfson.ox.ac.uk

The simulation results in figure 8B can be reproduced by roadRunner online and Copasi. We use a ceiling function to simulate the day-light cycle.

9 Derived Rate Equations

When interpreted as an ordinary differential equation framework, this model implies the following set of equations for the rates of change of each species.

Identifiers for kinetic laws highlighted in gray cannot be verified to evaluate to units of SBML substance per time. As a result, some SBML interpreters may not be able to verify the consistency of the units on quantities in the model. Please check if

- parameters without an unit definition are involved or
- volume correction is necessary because the `hasOnlySubstanceUnits` flag may be set to `false` and `spacialDimensions` > 0 for certain species.
